1    **Q.    Please state your name and business address.**

2    A.    My name is James Zolnierrek and my business address is 527 East Capitol  
3           Avenue, Springfield, Illinois 62701.

4

5    **Q.    By whom are you employed and in what capacity?**

6    A.    I am employed by the Illinois Commerce Commission (“Commission” or  
7           “ICC”) as the Policy Manager in the Telecommunications Division.

8

9    **Q.    Please state your education background and previous job**  
10       **responsibilities.**

11   A.    I earned my Bachelors of Science degree in mathematics from Michigan  
12       State University in 1990. I also earned from Michigan State University  
13       both a Master of Arts degree in economics in 1993 and a Doctor of  
14       Philosophy degree in economics in 1996.

15

16       I have been a Visiting Professor of Economics in the Department of  
17       Economics at both the University of Nebraska and Arizona State  
18       University. Prior to joining the Illinois Commerce Commission I was  
19       employed by the Federal Communications Commission (“FCC”) in the  
20       Common Carrier Bureau, Industry Analysis Division.

21

22    **OVERVIEW**

23

24 **Q. What is the purpose of your testimony?**

25 A. My testimony is comprised of two sections. In the first section I will  
26 address certain non-recurring cost estimates submitted by SBC Illinois  
27 (“Company”) in this proceeding. In particular, I will address the  
28 Company’s Stand Alone Unbundled Network Element (“UNE”) loop,  
29 Unbundled Network Element Platform (“UNE-P”), and Enhanced Extended  
30 Link (“EEL”) physical provisioning activity non-recurring cost estimates. In  
31 the second section I will address certain recurring cost estimates  
32 submitted by the Company in this proceeding. In particular, I will address  
33 the residential premises termination component of the Company’s  
34 recurring loop cost estimates.

35

36 **Q. What is the relationship between your testimony and the testimony**  
37 **of other Staff witnesses concerning recurring and non-recurring**  
38 **costs?**

39 A. My analysis of the Company’s non-recurring cost studies focuses on  
40 physical provisioning activities necessary to ensure that existing UNEs are  
41 physically connected to CLEC customer premises, to central office  
42 equipment, and, in the case of UNE combinations to each other. I am not  
43 the only Staff witness that will address physical provisioning costs. Other  
44 Staff witnesses address and propose changes that also impact Stand  
45 Alone Unbundled Network Element (“UNE”) loop, Unbundled Network  
46 Element Platform (“UNE-P”), and Enhanced Extended Link (“EEL”)

47 physical provisioning activity non-recurring cost estimates.<sup>1</sup> For example,  
48 Staff witness Mark Hanson (ICC Staff Ex. 6.0) proposes changes that  
49 reduce the wage estimates of the workers that perform the physical  
50 provisioning activities I examine. The non-recurring cost adjustments I  
51 and other Staff Witnesses propose will be incorporated into the cost  
52 estimates presented in the testimony of Mr. Hanson.

53  
54 My analysis of the Company's recurring cost studies focuses on the  
55 residential premises termination component of the Company's recurring  
56 loop cost estimates, and in particular how the Company treats multiunit  
57 residential dwellings. Other Staff witnesses propose changes that also  
58 impact the residential premises termination component of the Company's  
59 recurring loop cost estimates.<sup>2</sup> For example, Staff witness Peter Wagner  
60 (ICC Staff Ex. 13.0) proposes changes that will affect the depreciation  
61 lives of premises termination equipment. The recurring loop cost  
62 adjustments I and other Staff Witnesses propose will be incorporated into  
63 the cost estimates presented in the testimony of Staff witness Peter  
64 Lazare (ICC Staff Ex. 3.0).

---

<sup>1</sup> Staff witnesses Hanson (ICC Staff Ex. 6.0) and Michael McNally (Staff Ex. 12.0) will also address and propose changes that will impact Stand Alone Unbundled Network Element ("UNE") loop, Unbundled Network Element Platform ("UNE-P"), and Enhanced Extended Link ("EEL") physical provisioning activity non-recurring cost estimates.

<sup>2</sup> Staff witnesses Peter Lazare (ICC Staff Ex. 3.0), Robert Koch (ICC Staff Ex. 4.0), Qin Liu (ICC Staff Ex. 5.0), McNally (Staff Ex. 12.0) and Wagner (ICC Staff Ex. 13.0) will also address and propose changes that will impact the residential premises termination component of the Company's recurring loop cost estimates.

*Findings and Recommendations*

**Q. Please summarize your findings and recommendations in this proceeding.**

**A.** My findings and recommendations are as follows:

TELRIC Compliance: According to FCC rules, the Company bears the burden to prove that it has modeled an efficient network configuration as required by 47 C.F.R. § 51.505(b)(1). The Company has not met this burden. In fact, the evidence provided to this point by the Company demonstrates that the Company's cost studies used to determine rates for Non-Recurring Charges ("NRCs") were not developed in accordance with 47 C.F.R. § 51.505(b)(1). The Commission could, as explained by Staff Witness Hoagg,<sup>3</sup> reject the Company's current NRC cost studies.

I will, however, propose revisions to the Company's NRC cost studies in the event the Commission decides to accept them. The Commission should, however, be aware that even if it accepts the corrections proposed by Staff in place of the studies used by the Company, these Staff remedies are likely only to bring the Company's cost studies closer to compliance with 47 C.F.R. § 51.505(b)(1). In such a case, the Company's NRC cost studies will likely continue to fail to fully comply with 47 C.F.R. § 51.505(b)(1) and past Commission rulings regarding proper TELRIC

methodology and the Company will definitely not have met its burden of proof with respect to compliance with FCC rules.

Nonrecurring Special Access to UNE Conversion Cost Study: The Company does not provide credible support for its existing proposed Design & Coordination or Demarcation Re-tag cost estimates. If the Company does not provide credible support for its cost estimates or provide supportable revised estimates, the Company should not be allowed to include the special access to UNE combination conversion Design & Coordination or Demarcation Re-tag costs or any costs based on the activities supporting the Design & Coordination & Demarcation Re-tag in its TELRIC cost estimates.

Nonrecurring New EEL Combination Cost Study: The Company has not demonstrated that the activities listed in support of its New EEL Combination Cost Study are necessary assuming, as the FCC requires, the lowest cost network configuration and most efficient telecommunications technology available. The evidence in this proceeding suggests that in a number of cases provisioning of service may be performed more efficiently than is assumed in the Company's Nonrecurring New EEL Combination Cost Study. The Company has also made unsupported assumptions regarding location lives that yield

---

<sup>3</sup> Staff Ex. 1.0.

111 unsupported increases in its cost estimates. Based on this evidence, I  
112 make the following recommendations.

113  
114 With respect to Loop Connection cost estimates, if the Company cannot  
115 provide credible support for the differences between its proposed EEL  
116 Combination Loop Connection cost estimates and its Stand Alone Loop  
117 Connection cost estimates or provide supportable revised estimates, I  
118 recommend that the Commission require the Company to use the Stand  
119 Alone Loop Connection cost estimate approved by the Commission in this  
120 proceeding as the estimate of the EEL Combination Loop Connection  
121 cost.

122  
123 With respect to Dedicated Transport cost estimates, if the Company  
124 cannot provide credible support for the differences between the activities  
125 performed by SSC group when provisioning DS1 Dedicated Transport  
126 Non-Collocated and when provisioning Stand Alone DS1 loops, I  
127 recommend the Commission require the Company to calculate DS1  
128 Dedicated Transport Non-Collocated cost estimates assuming the  
129 activities performed by SSC when provisioning DS1 Dedicated Transport  
130 Non-Collocated are identical to those performed by SSC when  
131 provisioning Stand Alone DS1 loops.

Furthermore, if the Company cannot provide credible support for its 2-year location life assumption or provide a credibly supported revised location life applicable to its EEL Dedicated Transport offerings, I recommend that the Commission require that the Company exclude disconnect costs in the development of its EEL Dedicated Transport cost estimates.

With respect to the Central Office Multiplexing – DS1 to Voice cost estimate, the costs associated with this function appear to be already included with the estimated costs of DS1 Interoffice Dedicated Transport. If the Company cannot provide credible support to indicate that these estimated costs are not entirely duplicative and cannot revise its estimates to appropriately capture costs associated with any non-duplicative activities, I recommend that the Commission require the Company to exclude the separate cost estimate for Central Office Multiplexing – DS1 to Voice from its Nonrecurring New EEL Combination cost study.

With respect to the Clear Channel Capability cost estimates, if the Company cannot provide credible support to indicate that the timing of the \*\*\*XXXXXXXXXXXX\*\*\* used for purposes of computation of Clear Channel Capability cost estimates differs from the timing of the \*\*\*XXXXXXXXXXXX\*\*\* used for purposes of computation of the 4-Wire Digital Loop Connection cost estimates, I recommend that the Commission require the Company to reduce its \*\*\*XXXXXXXXXXXX\*\*\*

activity time estimate to \*\*\*XXXXXXXXXXXXXXXX\*\*\* when calculating  
Clear Channel Capability cost estimates.

Nonrecurring Unbundled Loop Cost Study: The Company has not  
provided credible support for its assumptions regarding location lives.  
Based on this evidence I make the following recommendations.

With respect to POTS, DS1 and DS3 Stand Alone Line Connection cost  
estimates and POTS and DS1 UNE-P Line Connection cost estimates, if  
the Company cannot provide credible support for its 2 year location life  
assumption or provide a credibly supported revised location life estimate, I  
recommend that the Commission require the Company to calculate the  
location life for each loop type based upon the average location life of the  
Company's comparable end-user offerings.

Additionally, if the Company cannot provide credible support for its work  
group occurrence factors, I recommend that the Commission require the  
Company to use occurrence factors when computing POTS UNE-P  
disconnect cost estimates that equal  $((1 - \text{the DIP rate adopted in this proceeding}) \text{ multiplied by } 0.086)$ .

Nonrecurring Unbundled Local Switching – Ports Study: The Company has not provided credible support for its assumptions regarding location lives. Based on this evidence I make the following recommendations.

With respect to Non-recurring Line and Trunk Port cost estimates, if the Company cannot provide credible support for its 2 year location life assumption or provide a credibly supported revised location life estimate, I recommend that the Commission require the Company to calculate the location life for each loop type based upon the average location life of the Company's comparable end-user offerings.

Nonrecurring Unbundled Port Features Study: The Company has not demonstrated that unbundled port features disconnect activities are necessary given port disconnect activities estimated elsewhere in the Company's filing. Furthermore, based on the Company's port connection cost estimates, feature add/change translation activities do not reflect least cost provisioning of port features.

Unless the Company can provide evidence that demonstrates that the disconnect activities are necessary the Commission should reject the Company's inclusion of disconnect activity costs in its Port Feature Add/Change Translation cost estimates. Furthermore, unless the Company can demonstrate that the provisioning activities necessary to

add/change a port feature exceed the provisioning activities necessary to provision a New UNE-P port the Commission should require the Company to replace the single Port Feature Add/Change Translation cost estimate (which includes costs for both initial and additional adds/changes) with the Line/Trunk Port cost estimate for new combination orders.

Recurring Loop Premises Termination Cost Study: The Company has failed to account for multi-dwelling units when developing its recurring loop premises termination cost estimates. If the Company cannot provide credible support for its premises termination estimates or cannot adjust these estimates to properly reflect the lowest cost network configuration and most efficient telecommunications technology, I recommend that the residential and business percentages input into the LoopCAT model be revised. I recommend that Percent Residential Premises Termination be set equal to \*\*\*XXXX\*\*\* and Percent Business Premises Termination be set equal to \*\*\*XXXXX\*\*\*.

#### **NON-RECURRING PROVISIONING COSTS**

**Q. What specific non-recurring cost estimates will you address in testimony?**

**A.** I will discuss non-recurring physical provisioning costs for Stand Alone Loops, UNE-Ps, and EELs. These cost estimates are addressed and

224 supported by SBC Illinois Witnesses Silver, Cass, Barch, and Gomez-  
225 McKeon.<sup>4</sup>

226

227 **TELRIC Compliance**

228

229 **Q. Please explain how the Company developed its cost study for these**  
230 **non-recurring cost estimates.**

231 A. SBC Illinois Witness Cass states:

232 All of the non-recurring cost studies presented in the case  
233 were developed in accordance with the procedure and  
234 methods described in Schedule CFC-4.<sup>5</sup>  
235

236 CFC-4, which is entitled “Non-Recurring Cost Studies, Study Description  
237 and Case Studies, Version 1.2, November 5, 2002” and which will be  
238 referred to hereafter as the “Company NRC Manual”, indicates:

239 \*\*\*XX  
240 XXX  
241 XXXXXXXX:  
242 XXX  
243 XXX  
244 XXX  
245 XXX<sup>6</sup>\*\*\*  
246

247 The Company NRC Manual further indicates that “[i]n developing activity  
248 times, they [subject matter experts, or SMEs] are to take into  
249 consideration labor-saving tools currently available to employees or

<sup>4</sup> SBC Illinois Exhibits 3.0, 6.0, 7.0, and 9.0, respectively.

<sup>5</sup> SBC Illinois Ex. 6.0 at 7-8.

<sup>6</sup> SBC Illinois Ex. 6.0, Schedule CFC-4 at 13. Emphasis added.

250 planned for deployment” and that employees should “not speculate.”<sup>7</sup> As  
251 SBC Illinois Witness Barch states:

252 Though future efficiencies are incorporated, speculation is  
253 minimized by confining future efficiencies to what is known,  
254 budgeted, planned and/or quantifiable. Such comprehensive  
255 instruction is clearly labeled in documentation for SBC Illinois’  
256 nonrecurring cost studies (e.g., Tab 8.x within studies).<sup>8</sup>

257  
258 Thus, the guidelines employed by the Company in developing non-  
259 recurring costs specifically direct SMEs not to speculate about activity  
260 times associated with currently available efficient telecommunications  
261 technology or least cost network configurations.

262

263 **Q. Do the FCC rules prescribe the efficient network configuration that**  
264 **must be used to develop TELRIC estimates?**

265 A. Yes. The FCC rules state:

266 The total element long-run incremental cost of an element  
267 should be measured based on the use of the most efficient  
268 telecommunications technology currently available and the  
269 lowest cost network configuration, given the existing location  
270 of the incumbent LEC wire centers.<sup>9</sup>  
271

272 **Q. Does the Company bear the burden to prove that it has modeled an**  
273 **efficient network configuration as required by 47 C.F.R. §**  
274 **51.505(b)(1)?**

275 A. Yes. The FCC rules state:

276 An incumbent LEC must prove to the state commission that  
277 the rates for each element it offers do not exceed the

---

<sup>7</sup> SBC Illinois Ex. 6.0, Schedule CFC-4 at 13-14.

<sup>8</sup> SBC Illinois Ex. 7.0 at 65.

<sup>9</sup> 47 C.F.R. § 51.505(b)(1).

forward looking economic cost per unit of providing the element, using a cost study that complies with the methodology set forth in this section and § 51.511.<sup>10</sup>

Thus, the Company must, according to the FCC rules, prove that the non-recurring cost estimates it submitted in this proceeding were developed based upon an efficient network configuration as prescribed by, among other FCC rules, the rule in 47 C.F.R. § 51.505(b)(1).

**Q. Has SBC Illinois presented credible evidence proving that the non-recurring cost estimates it submitted in this proceeding were developed based upon an efficient network configuration as prescribed by the FCC rules?**

A. No. The evidence indicates that the Company has failed to comply with the rules in 47 C.F.R. § 51.505(b)(1) to develop its non-recurring cost studies. The Company's methodology fails to consider all currently available telecommunications technology and does not assume the lowest cost network configuration.

**Q. Please explain how the Company's methodology is not based upon the efficient network configuration prescribed by the FCC.**

A. The FCC's rules prescribe that the Company must base its estimates on the "lowest cost network configuration and most efficient telecommunications technology available, given the existing location of the

---

<sup>10</sup> 47 C.F.R. § 51.505(e).

incumbent LEC wire centers.” The Company, however, has based its non-recurring cost estimates on its existing network design and on its existing systems.

SBC Illinois Witness Gomez-McKeon states “...the NRC studies are based on data that reflect the most efficient times that *SBC Ameritech Illinois* could reasonably expect to spend provisioning these products in the foreseeable future.”<sup>11</sup> However, this statement does not accurately reflect the Company’s methodology. The Company NRC studies are based on data that reflect times consistent with the manner in which SBC Illinois has *chosen* to provision products in the foreseeable future. The Company has neither shown that the provisioning methods it has elected to employ are the most efficient the Company could reasonably employ nor that these methods are based on the most efficient telecommunications technology currently available, or least cost network configurations.

The Company’s SMEs have followed the direction in the Company NRC Manual and have not considered activity times associated with currently available efficient telecommunications technology or least cost network configurations that the Company does not plan to deploy in Illinois. For example, when questioned about improvements or system enhancements

---

<sup>11</sup> SBC Illinois Ex. 9.0 at 9. Emphasis added.

324 that would affect activity time estimates, Terry Burge, the SME responsible  
325 for CP&M activity time estimates, states:

326 \*\*\*XX  
327 XXXXXXXXXXXXXXXXXXXXXXXXXXXX.\*\*\*<sup>12</sup>  
328

329 With respect to this same query, David Edens, the SME responsible for  
330 FOG activity time estimates, states:

331 \*\*\*XX  
332 XXXXXXXXXXXXXXXXXXXXXXXXXXXX\*\*\*<sup>13</sup>  
333

334 Jerry Reed, the SME responsible for CPC-HPC activity time estimates,  
335 also responds similarly stating:

336 \*\*\*XX  
337 XXXXXXXXXXXXXXXXXXXXXXXXXXXX\*\*\*<sup>14</sup>  
338 XXXXXXXXXXXXXXXXXXXXXXXXXXXX  
339

340 The Company's Cost Manual directs SBC Illinois SMEs to provide activity  
341 time estimates based on SBC Illinois' existing network design and on  
342 existing systems and not as FCC rules require on the lowest cost network  
343 configuration and most efficient telecommunications technology available.  
344 The evidence indicates that SMEs followed this direction and therefore did  
345 not consider whether times that SBC Illinois expects to spend provisioning  
346 products in the foreseeable future is equal to the most efficient times that  
347 SBC Illinois could reasonably expect to spend provisioning products

---

<sup>12</sup> Response to Joint CLEC's Data Request No. 1.52a, Attachment Burge, Terry Questionnaire (CP&M)(CLEC1-52a).doc, attached as Sched. 7.01.

<sup>13</sup> Response to Joint CLEC's Data Request No. 1.52a, Attachment Edens, David Questionnaire (FOG)(CLEC1-52a).doc, attached as Sched. 7.01.

<sup>14</sup> Response to Joint CLEC's Data Request No. 1.52a, Attachment Reed, Jerry Questionnaire (CPC-HPC)(CLEC1-52a).doc, attached as Sched. 7.01.

348 assuming, as prescribed by the FCC rules, the use of the most efficient  
349 telecommunications technology currently available and the lowest cost  
350 network configuration.

351

352 **Q. Mr. Cass indicates that the workgroup SMEs relied on by the**  
353 **Company to develop its estimates are qualified to provide forward-**  
354 **looking activities, times, and percent occurrences.<sup>15</sup> Please evaluate**  
355 **Mr. Cass' assessment.**

356 A. Whether or not the SMEs are able to provide such estimates is irrelevant.  
357 The Company NRC Manual gives improper direction to SMEs regarding  
358 development of estimates, because it directs them to base such estimates  
359 on SBC's existing network design and on existing systems and not as  
360 FCC rules require on the lowest cost network configuration and most  
361 efficient telecommunications technology available.

362

363 **Q. Is there any indication that the times that SBC Illinois expects to**  
364 **spend provisioning products in the foreseeable future is greater than**  
365 **the most efficient times that SBC Illinois could reasonably expect to**  
366 **spend provisioning products assuming, as prescribed by the FCC**  
367 **rules, the use of the most efficient telecommunications technology**  
368 **currently available and the lowest cost network configuration?**

369 A. Yes. The Company's Cost Manual includes the following Q&A:

---

<sup>15</sup> SBC Illinois Ex. 6.0 at 6.

370 \*\*\*XX  
371 XXXXXXXXXX  
372  
373 XXX  
374 XXX  
375 XXX  
376 XXX  
377 XXX  
378 XXX  
379 XXXXXXXXXXXXXXXXXXXXXXX  
380  
381 XXX  
382 XXX  
383 XXX  
384 XXX  
385 XXX  
386 XXX\*\*\*  
387

388 As this passage indicates the Company's non-recurring cost studies and  
389 results of those studies vary among the states because the Company  
390 \*\*\*XX  
391 XXXXXXXXXXXXXXXXXXXXXXX\*\*\* Even if SBC has not been able to fully  
392 implement consistent, best practices for order processing and  
393 provisioning, it must, according to the FCC rules, assume best practices  
394 for the purposes of its non-recurring cost studies. As the Company's Cost  
395 Manual indicates, the Company has not for the purposes of its non-  
396 recurring cost studies relied on the least cost systems, methods and  
397 procedures currently available. In fact, as the Company Cost Manual  
398 indicates, the Company has not, for the purposes of its non-recurring cost  
399 studies, even considered the least cost systems, methods and procedures  
400 that SBC itself currently uses in its other service territories.  
401

402 **Q. Is the Company's approach consistent with past Commission rulings**  
403 **regarding TELRIC methodology?**

404 A. No. In ICC Docket No. 98-0396 the Commission addressed the  
405 Company's NRC study, stating:

406 The NRC study submitted falls short of expectations. A number of  
407 observations are warranted.

408  
409 First, rather than base its nonrecurring costs studies upon forward  
410 looking, least cost, most efficient network technologies, processes  
411 and systems, including Operational Support Systems, or OSSs,  
412 Ameritech's studies are based on its *existing* network architecture  
413 and processes and incorporate only those technologies and  
414 process improvements that Ameritech *actually* plans to deploy in  
415 the next three years.<sup>16</sup>  
416

417 The first deficiency identified by the Commission in its review of the  
418 Company's previously submitted NRC cost study is the Company's  
419 approach of basing estimates on the Company's existing network  
420 architecture and processes and on technologies and process  
421 improvements the Company plans to deploy rather than on forward  
422 looking, least cost, most efficient network technologies, processes and  
423 systems. The NRC cost studies filed by the Company in this proceeding  
424 suffer the same deficiencies the Commission identified with respect to the  
425 previously filed Company NRC cost studies. The Commission has already  
426 ruled on this issue. The Commission, accordingly, could reject the  
427 Company's current NRC cost studies for the very same reasons it has  
428 previously rejected them.

429

430 **Q. What are the possible effects of permitting the Company to recover**  
431 **costs based on its *existing* network architecture and processes and**  
432 **only those technologies and process improvements that SBC Illinois**  
433 ***actually* plans to deploy rather than requiring the Company to base**  
434 **its nonrecurring costs studies upon forward looking, least cost, most**  
435 **efficient network technologies, processes and systems as required**  
436 **by the FCC?**

437 A. It can result in cost estimates that exceed the forward-looking costs  
438 prescribed by the FCC. This will, at least on the margin, reduce the ability  
439 of CLECs to profitably compete using UNEs. Second, it will reduce  
440 incentives for the Company to adopt forward looking least cost technology.  
441 That is, if the Company is compensated for its actual practices  
442 independent of any inefficiency in those processes, it has every incentive  
443 to adopt inefficient practices, increase its UNE rates, and, therefore,  
444 reduce the ability of CLECs to competitively provide services using UNEs.

445

446 *Findings and Recommendations*

447

448 **Q. Please summarize your analysis of the TELRIC compliance of the**  
449 **Company's NRC cost studies and your recommendation with respect**  
450 **to this issue.**

451 A. According to FCC rules the Company bears the burden to prove that it has  
452 modeled an efficient network configuration as required by 47 C.F.R. §

---

<sup>16</sup> Commission Order in Docket No. 98-0396 (Oct. 16, 2001), at 39, emphasis from original.

453 51.505(b)(1). The Company has not met this burden. In fact, the  
454 evidence provided to this point by the Company demonstrates that the  
455 Company's NRC cost studies were not developed in accordance with 47  
456 C.F.R. § 51.505(b)(1). The Commission could, as explained by Staff  
457 Witness Hoagg,<sup>17</sup> reject the Company's current NRC cost studies.

458  
459 Below, in my examination of specific non-recurring provisioning studies, I  
460 will address numerous instances where the Company's approach has led  
461 to identifiable overstatements of forward looking costs. However, the  
462 Company's flawed development process likely leads to broader  
463 overstatements of cost that are not necessarily identifiable from the  
464 evidence submitted by the Company. For example, instances where the  
465 Company uses more efficient systems, methods and procedures in other  
466 Company service territories but where the Company does not base its  
467 NRC studies on these Company best practices, will generate  
468 overstatements of forward looking TELRIC costs.

469  
470 The evidence submitted by the Company indicates that the Company has  
471 not followed FCC TELRIC rules, and in particular, 47 C.F.R. §  
472 51.505(b)(1). Informational asymmetries do not permit Staff to propose  
473 cost study revisions that will remedy every instance in which the Company  
474 has failed to comply with 47 C.F.R. § 51.505(b)(1). Nor, as the FCC rules  
475 dictate, is this a burden that must be assumed by Staff. Nevertheless, I

---

<sup>17</sup> Staff Ex. 1.0.

will propose revisions to the Company's NRC cost studies. The Commission should, however, be aware that even if it accepts the corrections I propose, these remedies are likely only to bring the Company's cost studies closer to compliance with 47 C.F.R. § 51.505(b)(1). In such a case the Company's NRC cost studies will likely continue to fail to fully comply with 47 C.F.R. § 51.505(b)(1) and past Commission rulings regarding proper TELRIC methodology and the Company will definitely not have met its burden of proof with respect to compliance with FCC rules.

***Nonrecurring Special Access to UNE Conversion Cost Study***

*Overview*

**Q. What is a Special Access to UNE Conversion?**

A. The Company's Nonrecurring Special Access to UNE Conversion Cost Study states:

The FCC's Remand Order allows Telecommunications Carriers (TCs)/Competitive Local Exchange Carriers (CLECs) to reconfigure Special Access arrangements to combinations of loop and transport unbundled network element (UNEs), providing they meet certain criteria.<sup>18</sup>

In describing the conversion process in recent comments to the FCC, SBC Communications, Inc., stated:

---

<sup>18</sup> SBC Illinois Ex. 6.0, Schedule CFC-3, TAB 1.

By definition, a conversion can occur only if the requesting carrier already is using special access services to provide the services that it seeks to offer; otherwise there would be nothing to convert. ... [T]he only effect of a conversion would be to bestow on that carrier a price break – and hence higher profits – for a service that it already is providing.<sup>19</sup>

Thus, a special access to UNE conversion is, by the Company's own admission, little more than a billing change.

**Q. Are the activities listed in the Company's Nonrecurring Special Access to UNE Conversion Cost Study consistent with the notion that, from a provisioning standpoint, such conversions are little more than billing changes?**

**A.** Yes. The Company lists two types of provisioning costs for Special Access to UNE Conversions, "Design & Coordination" costs and "Demarcation Re-tag" costs.<sup>20</sup> The information submitted by the Company indicates that none of the activities listed in support of these cost estimates are required to physically provision the loop.

*Design & Coordination Costs*

---

<sup>19</sup> Comments of SBC Communications, Inc., In the Matter of Review of the Section 271 Unbundling Obligations of Incumbent Local Exchange Carriers, Implementation of the Local Competition Provisions of the Telecommunications Act of 1996, and Deployment of Wireline Services Offering Advanced Telecommunications Capability, CC Docket Nos. 01-338, 96-98, and 98-147, April 5, 2002, at 105. Qwest similarly has stated, "...it is conceded in the industry that all that is required to convert a special access circuit to a UNE is a billing change." Comments of Qwest Corporation in Response to Public Notice, In the Matter of Implementation of the Local Competition Provisions of the Telecommunications Act of 1996, CC Docket No. 96-98, April 5, 2001 at 8.

<sup>20</sup> SBC Illinois Ex. 6.0, Schedule CFC-3, TAB 3.

523 **Q. What activities do the Company list in support of the “Design and**  
524 **Coordination” cost estimate?**

525 A. The Company lists activities performed by both its High Capacity  
526 Provisioning Center (HPC) and it’s Special Services Center (SSC). The  
527 specific tasks listed for HPC include:

528 \*\*\*XX  
529 XXX  
530 XXX  
531 XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX<sup>21\*\*\*</sup> The specific tasks listed

532 for SSC include:

533 \*\*\*XX  
534 XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX<sup>22\*\*\*</sup> The  
535 tasks performed by these groups is summarized best by the following  
536 passage taken from the flow chart submitted by the Company to describe  
537 the conversion process:

538 \*\*\*XX  
539 XXX  
540 XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX<sup>23\*\*\*</sup>

541  
542 That is, the activities performed by HPC and SSC ensure that no physical  
543 work is actually done in the conversion process.

544

<sup>21</sup> SBC Illinois Ex. 6.0, Schedule CFC-3, TAB 8.3-HPC.

<sup>22</sup> SBC Illinois Ex. 6.0, Schedule CFC-3, TAB 8.5-SSC.

<sup>23</sup> SBC Illinois Ex. 6.0, Schedule CFC-3, TAB 1.11.

545 **Q. Has the Company demonstrated that these activities are necessary**  
546 **assuming the lowest cost network configuration and most efficient**  
547 **telecommunications technology available as required by the FCC's**  
548 **TELRIC rules?**

549 A. No. The Company has offered no evidence to suggest that these  
550 activities are consistent with the use of the most efficient  
551 telecommunications technology currently available and the lowest cost  
552 network configuration. In support of the Design & Coordination cost  
553 estimate, the Company lists activities that its provisioning groups must  
554 perform to ensure that no physical work is performed when special access  
555 circuits are converted to combinations of UNEs. The Company's current  
556 system does not permit a circuit to be moved from one billing database to  
557 another without issuance of both a disconnect order and an add order.  
558 According to the Company's Nonrecurring Special Access to UNE  
559 Conversion Cost Study, the HPC and SSC groups spend on average  
560 **\*\*XX\*\*** minutes working time in the case of an end-user DS1 to DS3  
561 terminating in a collocation arrangement configuration to prevent the  
562 disconnect and add orders from being acted upon.

563

564 Furthermore, Mr. Cass, the Company witness with respect to special  
565 access to UNE combination provisioning cost estimates, provides no  
566 explanation in support of the Company's approach, stating only:

567 ...the record work only charge is intended to recover only the cost  
568 of changing records. It is not properly applicable to UNE-P

migrations, which involve additional service order work other than simply changing a record, and it is even less applicable to Special Access to UNE Conversions.<sup>24</sup>

The evidence submitted by the Company suggests that the tasks associated with the Design & Coordination cost estimate are those tasks that would be associated with a record change. That is, the circuit being purchased is not being physically changed but is merely being identified as a UNE combination rather than a special access circuit. The Design and Coordination cost estimate, therefore, does not represent the estimated costs of activities performed by the Company's physical provisioning group to physically provision the circuit, but rather represents the estimated costs of activities performed to by the Company's physical provisioning group to ensure that they don't physically provision the circuit. Based on the evidence in this proceeding, it appears that these tasks are designed to overcome an inefficient provisioning system rather than to work in conjunction with the most efficient technology currently available, and that they would not be required absent an inefficient provisioning system.

**Q. What adjustment would you recommend the Commission make with respect to the Design & Coordination cost estimate?**

A. If the Company cannot provide credible support for its existing proposed Design & Coordination cost estimates or provide supportable revised estimates, I recommend that the Company proposal to include in its

---

<sup>24</sup> SBC Illinois Ex. 6.0 at 33.

594 TELRIC cost estimates special access to UNE Design & Coordination  
595 costs, or to include costs based on the activities supporting the  
596 Company's Design & Coordination cost estimates, be denied.  
597

598 *Demarcation Re-tag Costs*  
599

600 **Q. What activities do the Company list in support of the "Demarcation**  
601 **Re-tag" cost estimate?**

602 A. The Company lists activities performed by its Digital Operations Group  
603 (DOG). The specific tasks listed for DOG include:

604 XX

605 XX

606 XXXXXXXXXXXXXXXXXXXXXXXX<sup>25</sup>\*\*\*

607

608 **Q. How does the Company develop its cost estimates for these**  
609 **activities?**

610 A. According to the Company's Nonrecurring Special Access to UNE  
611 Conversion Cost Study, DOG spends \*\*XXXX\*\* hours retagging loops, on  
612 average, in the case of a end-user DS1 to DS3 terminating in a collocation  
613 arrangement configuration. In addressing the reason for this activity Mr.  
614 Cass states:

---

<sup>25</sup> SBC Illinois Ex. 6.0, Schedule CFC-3, TAB 8.4-DOG.

One of the most important reasons for re-tagging the circuits at the customer premises is to avoid confusion if the customer calls in trouble reports.<sup>26</sup>

He further states that:

...it is imperative that the circuits IDs at the customer premises are re-tagged to match the IDs in SBC Illinois' operational systems.<sup>27</sup>

Ms. Gomez-McKeon similarly states:

This change at the field locations is required for elimination of maintenance issues in the future. If this information is not properly changed in the field it could delay the responsiveness of the trouble isolation, and cause the CLEC to have duplicate records of retaining old circuit information and new circuit information.<sup>28</sup>

**Q What are the deficiencies in the support provided for these activities?**

A. It is not clear that this tagging activity is necessary. My conclusion is based on evidence on this issue provided by Company witnesses themselves.

**Q. Are the activities performed by DOG consistent with the activities necessary assuming the lowest cost network configuration and most efficient telecommunications technology available?**

A. The support provided by the Company with respect to its Demarcation Re-tag cost estimate does not prove that these activities are necessary assuming the lowest cost network configuration and most efficient

---

<sup>26</sup> SBC Illinois Ex. 6.0 at 31.

<sup>27</sup> SBC Illinois Ex. 6.0 at 31.

<sup>28</sup> SBC Illinois Ex. 9.0 at 21.

telecommunications technology available. Furthermore, the evidence in this proceeding suggests that these activities may not be necessary for the reasons stated by the Company witnesses.

First, the Company does not actually perform the re-tagging activity at the time of conversion. The Company's Nonrecurring Special Access to UNE Conversion Cost Study indicates that retagging "...will occur on the next scheduled visit..."<sup>29</sup> Thus, if the Company receives a trouble report on the circuit following installation but before any scheduled visit, then the Company does not "avoid confusion" with respect to the visit. Any maintenance and repair savings cited by Mr. Cass or Ms. Gomez-McKeon to justify this activity does not occur with respect to such maintenance and repair visits. The Company may, however, experience maintenance and repair savings on subsequent repair visits. However, there is no information to suggest how frequently or infrequently subsequent visits occur. Nor has the Company provided information that would indicate that the benefits it receives on such subsequent repair visits, if any, exceed the costs of the tagging activities listed by Mr. Cass.

Furthermore, the Company has failed to demonstrate that lines which are not retagged cause "confusion." The claim of confusion assumes that customers would purchase multiple loops. The evidence, however, does not support this assumption. For example, the Company estimates

665 indicate that for configuration of end-user DS1s and interoffice DS3s  
666 connecting to a collocation cage, \*\*\*XXXXXXXXXXXXXXX\*\*\* DS1s in such  
667 configurations go to unique locations.<sup>30</sup> In fact, Mr. Cass states:

668 The cost studies for the DS1 and DS3 loops assumed that  
669 customers would not purchase more than one loop at a time,  
670 because these services are much less common and more  
671 expensive than the line connection charge, and will typically directly  
672 meet the needs of the customer without the need of additional  
673 loops.<sup>31</sup>  
674

675 Thus, the evidence presented by the Company indicates that multiple DS1  
676 terminations at end-user locations are relatively unusual. This suggests  
677 that if a technician is servicing a DS1 at an end-user location there will be  
678 little confusion as to which DS1 is in need of service or testing as, by the  
679 Company's own admission, there is generally only one to select from.

680  
681 Finally, the Company has not explained why TAG information need  
682 change when an existing circuit is converted from a Special Access to a  
683 UNE combination. Presumably, the Company can match the existing  
684 interoffice and end-office circuit information when the circuit is provided as  
685 a special access line. It is unclear why this same information would not  
686 suffice to avoid confusion when the special access combination is  
687 converted to a UNE combination.

688

---

<sup>29</sup> SBC Illinois Ex. 6.0, Schedule CFC-3, TAB 8.4-DOG.

<sup>30</sup> SBC Illinois Ex. 6.0, Schedule CFC-3, TAB 6.2.

<sup>31</sup> SBC Illinois Ex. 6.0 at 23.

689 **Q. Even if the Company is able to demonstrate a need for retagging,**  
690 **does the Company's retagging cost estimate accurately reflect the**  
691 **tasks associated with this activity?**

692 A. No. The Company assumes task and work occurrence factors of 100%,  
693 which means that retagging is performed in every case.<sup>32</sup> However, there  
694 is reason to believe that, in some cases, the retagging function is never  
695 performed. For example, the Company does not actually perform the  
696 retagging activity at the time the conversion is completed. Furthermore,  
697 even in instances where retagging does occur, there is a lag between the  
698 time the circuit is converted and the time retagging is completed. The  
699 Company, however, estimates the cost of tagging as though it occurs at  
700 the time of conversion. This approach fails to properly determine the  
701 present value of the cost of these future activities, nor does it account for  
702 expected inflation and/or productivity between the time the circuit is  
703 converted and the time the retagging function is performed.

704

705 **Q. What adjustment should the Commission make with respect to the**  
706 **Demarcation Re-tag cost estimate?**

707 A. If the Company cannot provide credible support for its existing proposed  
708 Demarcation Re-tag cost estimate or provide supportable revised  
709 estimates, the Company should not be allowed to include in its UNE cost  
710 estimates special access to UNE combination conversion Demarcation

---

<sup>32</sup> SBC Illinois Ex. 6.0, Schedule CFC-3, TAB 6.2.

711 Re-tag costs or any costs based on the activities supporting the  
712 Demarcation Re-tag cost estimates.

713

714 *Findings and Recommendations*

715

716 **Q. Please summarize your analysis of the Nonrecurring Special Access**  
717 **to UNE Conversion Cost Study and your recommendation with**  
718 **respect to the Company's proposed cost estimates.**

719 A. The Company does not provide credible support for its proposed Design &  
720 Coordination or Demarcation Re-tag cost estimates. If the Company does  
721 not provide credible support for its proposed cost estimates or provide  
722 supportable revised estimates, the Company should not be allowed to  
723 include special access to UNE combination conversion Design &  
724 Coordination or Demarcation Re-tag costs or any costs based on the  
725 activities supporting the Design & Coordination and Demarcation Re-tag  
726 cost estimates in its TELRIC cost estimates.

727

728 ***Nonrecurring New EEL Combination Cost Study***

729

730 *Overview*

731

732 **Q. What is a new EEL combination?**

733 A. The Company's New EEL Combination Cost Study describes a new EEL  
734 combination as:

735 ...a new combination of Unbundled Network Elements (UNEs)  
736 consisting of certain Unbundled Loops and certain Unbundled  
737 Dedicated Transport, combined by SBC, using the appropriate  
738 Cross-connects, and where needed, multiplexing.<sup>33</sup>  
739  
740

741 **Q. Please explain how the Company's new EEL provisioning costs are**  
742 **structured.**

743 A. There are four general types of costs included in the Company's  
744 Nonrecurring New EEL Combination Cost Study: (1) loop connection  
745 costs, (2) dedicated transport costs, (3) multiplexing costs, and (4) clear  
746 channel capability costs.

747

748 *Loop Connection Costs*  
749

750 **Q. Please explain the Company's general approach to estimation of**  
751 **Loop Connection costs.**

752 A. There are currently four basic loop types specifically identified in the  
753 Company's EEL tariff: 2-Wire Analog Loops, 2-Wire Digital Loops, 4-Wire  
754 Analog Loops and 4-Wire Digital Loops.<sup>34</sup> In developing Loop Connection  
755 costs for 2-Wire Analog Loops, 2-Wire Digital Loops, and 4-Wire Analog  
756 Loops the Company includes, among its list of provisioning activities, the

---

<sup>33</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 8.8-DOG.

<sup>34</sup> ILL. C.C. No. 20, Part 19, Section 20, 4<sup>th</sup> Revised Sheet No. 1.

establishment of cross-connects at the customer's premises,<sup>35</sup> at the main distribution frame (MDF),<sup>36</sup> and at the intermediate distribution frame (IDF).<sup>37</sup> In developing Loop Connection costs for 4-Wire Digital Loops the Company includes, among its list of provisioning activities, the establishment of cross-connects at the customer's premises<sup>38</sup> and, presumably at the MDF, IDF and Digital Cross-Connect Panel (DSX1)<sup>39</sup>, or, alternatively, at only the DSX1.<sup>40</sup>

**Q. What workgroups perform the activities the Company lists in support of its Loop Connection costs?**

A. For 2-Wire Analog Loops, 2-Wire Digital Loops, and 4-Wire Analog Loops the Company estimates Loop Connection costs based on the activities performed by five workgroups: the Loop Assignment Center (LAC), the Circuit Provisioning Center (CPC), the Field Operations Group (FOG), the Special Services Center (SSC), and the Digital Operations Group (DOG). For 4-Digital Loops the Company estimates Loop Connection costs based on the activities performed by four workgroups: the Hi-Cap Provisioning Center (HPC), the Field Operations Group (FOG), the Special Services Center (SSC), and the Digital Operations Group (DOG).

---

<sup>35</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 1.

<sup>36</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 6.2.

<sup>37</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 6.2.

<sup>38</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 8.8-DOG.

<sup>39</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 1.6.

<sup>40</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 1.12.

777 **Q. Are the activities performed by these workgroups consistent with the**  
778 **activities necessary assuming the lowest cost network configuration**  
779 **and most efficient telecommunications technology available?**

780 A. The Company has not demonstrated that the activities it lists in support of  
781 its Loop Connection costs are those activities that would be necessary  
782 assuming the lowest cost network configuration and most efficient  
783 telecommunications technology available. Furthermore, the evidence in  
784 this proceeding suggests that a number of the activities listed in support of  
785 the Loop Connection costs may not be necessary or may be performed  
786 more efficiently than is assumed in the Company's Nonrecurring New EEL  
787 Combination Cost Study.

788

789 **Q. Please describe the evidence that suggests that activities listed in**  
790 **support of the Loop Connection costs may not be necessary or may**  
791 **be performed more efficiently than is assumed in the Company's**  
792 **Nonrecurring New EEL Combination Cost Study.**

793 A. The Company provides unbundled loops to CLECs in a number of  
794 different circumstances including instances where the loops are  
795 provisioned to CLEC's collocation arrangements (Stand Alone Loops),  
796 instances where the loops are provisioned in combination with the  
797 Company's unbundled local switching and shared transport offerings  
798 (UNE-P Combination Loops), and (as is the focus of the Company's  
799 Nonrecurring New EEL Combination Cost Study) in instances when the

loops are provisioned in conjunction with the Company's unbundled dedicated transport offerings (EEL Combination Loops). The Company has provided cost studies that include Loop Connection costs associated with each of these different scenarios. As a result the Company has produced three different estimates of Loop Connection costs for 2-Wire Analog loops.

Figure 1: Loop Connection Costs – 2-Wire Analog Loops				
Configuration	Initial Install	Initial Disconnect	Additional Install	Additional Disconnect
Stand Alone Loop	XXXXX	XXXXX	XXXXX	XXXXX
UNE-P Combo Loop	XXXXX	XXXXX	XXXXX	XXXXX
EEL Combo Loop	XXXXX	XXXXX	XXXXX	XXXXX

As Figure 1 illustrates, the Company produces widely varying Loop Connection cost estimates for the different 2-Wire Analog loops configuration scenarios. The Company fails to adequately support the dramatic differences between provisioning activities associated with what appear to be very similar products, particularly in the case of Stand Alone and EEL Combination loops.

**Q. Please explain the similarities between Stand Alone and EEL Combination loops.**

817 A. As explained above, in developing Loop Connection costs for 2-Wire  
818 Analog EEL Combination loops the Company includes, among its list of  
819 provisioning activities, the establishment of cross-connects at the end  
820 user's premises, at the MDF, and at the IDF. In developing Loop  
821 Connection costs for 2-Wire Analog Stand Alone loops the Company  
822 includes these same provisioning activities.<sup>41</sup> The only difference  
823 identified with respect to these cross-connect activities, is that in the case  
824 of EEL Combination loops the IDF is assumed cross-connected to the  
825 DSX-1 while in the case of the Stand Alone loops the IDF is assumed  
826 cross-connected to a CLEC collocation arrangement.

827

828 **Q. Given the similarities between the EEL Combination and Stand Alone**  
829 **2-Wire Analog loop provisioning arrangements, why are the cost**  
830 **estimates produced by the Company different?**

831 A. There are a number of assumptions made by the Company that create the  
832 cost estimate differentials. First, with respect to EEL Combination 2-Wire  
833 Analog loops, the Digital Operations Group (DOG) performs the physical  
834 outside plant work, while with respect to Stand Alone 2-Wire Analog loops  
835 Circuit Provisioning & Maintenance (CP&M) performs the physical outside  
836 plant work. The functions performed by the respective groups are, based  
837 on the Company's cost studies, identical.<sup>42</sup> Nevertheless, the DOG group  
838 appears to be less efficient than the CP&M group. For example, DOG

---

<sup>41</sup> SBC Illinois Ex. 6.0, Schedule CFC-1, TAB 6.3.

estimated travel time to work locations equals **\*\*XXXXXX\*\*** while CP&M  
estimated travel time to work locations equals **\*\*XXX\*\***.<sup>43</sup> Similarly  
estimated DOG time to conduct circuit testing takes **\*\*XXXX\*\*** while  
estimated CP&M time to conduct circuit testing takes **\*\*XXXXXXXX\*\***.<sup>44</sup>  
These discrepancies suggest that DOG is less efficient in performing 2-  
Wire Analog loop provisioning than is CP&M.

Second, while the Company assumes, in the case of Stand Alone loops,  
that **\*\*XXXX\*\*** of 2-Wire Analog loops require no physical outside plant  
work by CP&M, the Company assumes that in the case of EEL  
Combination loops, all 2-Wire Analog loops require physical plant work by  
DOG. There is no evidence that a 2-Wire Analog loop that is ordered as  
part of an EEL is any more likely to require physical outside plant work  
than is a 2-Wire Analog loop ordered as a Stand Alone loop.

Finally, when supporting its Loop Connection cost estimates for  
provisioning a 2-Wire Analog loop that is part of an EEL, the Company  
lists testing and problem resolution activities performed, respectively, by  
the Special Services Center (SSC) and the Circuit Provisioning Center  
(CPC).<sup>45</sup> The Company has not demonstrated that these additional

---

<sup>42</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 6.2, Lns 47-52 and SBC Illinois Ex. 6.0, Schedule CFC-1, TAB 6.3, Lns 1-6.

<sup>43</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 6.2, Ln 49 and SBC Illinois Ex. 6.0, Schedule CFC-1, TAB 6.3, Ln 3.

<sup>44</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 6.2, Ln 51 and SBC Illinois Ex. 6.0, Schedule CFC-1, TAB 6.3, Ln 5.

<sup>45</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 6.2

859 activities are necessary when 2-Wire Analog loops are provisioned as a  
860 part of an EEL and not when the 2-Wire Analog loop is provisioned as a  
861 Stand-Alone loop.

862

863 **Q. Have you identified any other deficiencies in the methodology used**  
864 **by the Company to estimate EEL Loop Connection costs?**

865 A. Yes. Under the Company's proposed structure both installation and  
866 disconnection are included in the estimates of Loop Connection costs.  
867 That is, both activities are included within the single Loop Connection rate,  
868 which the Company assesses at the time the EEL is provisioned.

869

870 In calculating the disconnect portion of the Loop Connection cost the  
871 Company assumes that the average location life of an EEL loop is 2  
872 years.<sup>46</sup> In order to adjust the Loop Connection cost estimate to account  
873 for the time between the assessment of Loop Connection Rates and the  
874 time the projected disconnection occurs, the Company inflates the  
875 disconnect portion of the Loop Connection cost estimate to account for 2  
876 years of labor rate inflation and then calculates the present value of  
877 projected disconnection costs assuming a cost of money equal to

878 \*\*\*XXXXX\*\*\*.<sup>47</sup>

879

---

<sup>46</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 1.

<sup>47</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 1.

The Company provided no support for the 2 year average location life with its filing. In response to Staff's request to "[p]lease provide any or all information that the Company used to derive the location life of 2 years assumed in TAB 1 of Schedule CFC-2" the Company stated:

The 2 year life is reflective of the recognition that due to the nature of using UNEs to provide service to CLECs' end-users, there is more churn being experienced for local competition. Since CLECs do not incur the same capital costs as the ILECs, it is believed that they will not tie their customers into the longer term contracts that ILECs need.<sup>48</sup>

Thus, the Company indicates that ILEC contract term lengths are longer than the 2 year location life assumed for EELs. The Company then speculates that CLECs may not tie their customers into contracts for term lengths as long as those typically used by ILECs. Based upon its qualitative speculation that CLEC customer term lengths are shorter than ILEC customer term lengths, the Company makes what is presumably an arbitrary downward quantitative adjustment to location life based upon its unsupported qualitative speculation. The Company's response, which presumably includes any and all information the Company relied on to develop the 2 year location life, fails to provide support for its assumed location life.

The disconnect portion of the Loop Connection cost is a strictly decreasing function of assumed location life. Therefore, if the location life assumed is shorter than the average forward looking location life, the Company's Loop

Connection cost estimates will be overstated. Therefore, the unsupported assumption that term length for CLEC customers are shorter than the term lengths presumably experienced by the Company, yields an unsupported increase in the EEL Loop Connection cost estimate.

The Company's calculation of disconnect fees also fails to account for the churn referred to by the Company. Customers leaving CLECs are customers that in some and, perhaps most cases, return to the Company for retail service. Nevertheless, the Company assumes that in all cases loops serving these customers are disconnected. While it may be that in every case the Company disconnects central office cross connections, the Company would not presumably remove outside plant cross-connects when it wins a customer back. The Company estimation methodology, however, assumes that the Company will in every case remove outside plant cross-connects. In this respect, the Company's estimates are deficient.

**Q. What adjustment should the Commission make with respect to the EEL Combination Loop Connection cost estimates?**

A. If the Company cannot provide credible support for the differences between its proposed EEL Combination Loop Connection cost estimates and its Stand Alone Loop Connection cost estimates or provide supportable revised estimates, I recommend that the Commission require

---

<sup>48</sup> Response to Staff Data Request No. JZ 1.14, attached as Sched. 7.02.

929 the Company use its Stand Alone Loop Connection cost estimates as the  
930 estimates of EEL Combination Loop Connection costs.<sup>49</sup>

931

932 *Dedicated Transport Costs*  
933

934 **Q. Please explain the Company's general approach to estimation of**  
935 **Dedicated Transport costs.**

936 A. There are currently two basic dedicated transport types specifically  
937 identified in the Company's EEL tariff: DS1 Dedicated Transport and DS3  
938 Dedicated Transport.<sup>50</sup> The Company estimates transport costs  
939 separately for dedicated transport that the Company provisions to CLECs'  
940 collocation arrangements and for dedicated transport that the Company  
941 provisions to CLECs' non-collocated facilities. In developing Dedicated  
942 Transport Collocated costs, the Company includes, among its list of  
943 provisioning activities, the establishment of cross-connects at the serving  
944 wire center and end-office.<sup>51</sup> In developing Dedicated Transport Non-  
945 Collocated costs, the Company includes, among its list of provisioning  
946 activities, the establishment of cross-connects at the serving wire center  
947 and end-office<sup>52</sup> and at the CLECs facilities (i.e. customer premises).<sup>53</sup>

---

<sup>49</sup> My recommendations to correct disconnect portion of the Stand Alone Loop Connection charge will, if EEL Loop Connection charges mirror Stand Alone Loop Connection charges, address the deficiencies I have identified with respect to disconnect portion of EEL Loop Connection charges.

<sup>50</sup> ILL. C.C. No. 20, Part 19, Section 20, 4<sup>th</sup> Revised Sheet No. 1.

<sup>51</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 1.6.

<sup>51</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 6.2.

<sup>52</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 1.6.

<sup>52</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 6.2.

<sup>53</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 8.8-DOG.

948

949 **Q. What workgroups perform the activities the Company lists in support**  
950 **of its Dedicated Transport cost estimates?**

951 A. The Company estimates its Dedicated Transport costs based on the  
952 activities performed by four workgroups: the Hi-Cap Provisioning Center  
953 (HPC), the Field Operations Group (FOG), the Special Services Center  
954 (SSC), and the Digital Operations Group (DOG).

955

956 **Q. Are the activities performed by these workgroups necessary**  
957 **assuming the lowest cost network configuration and most efficient**  
958 **telecommunications technology available?**

959 A. The Company has not demonstrated that the activities it lists in support of  
960 its Dedicated Transport costs are those activities that would be necessary  
961 assuming the lowest cost network configuration and most efficient  
962 telecommunications technology available. Furthermore, the evidence in  
963 this proceeding suggests that some of the activities listed in support of the  
964 Loop Connection cost estimates may not be necessary or may be  
965 performed more efficiently than is assumed in the Company's  
966 Nonrecurring New EEL Combination Cost Study.

967

968 **Q. Please describe the evidence that suggests that activities listed in**  
969 **support of the Dedicated Transport cost estimates may not be**

necessary or may be performed more efficiently than is assumed in the Company's Nonrecurring New EEL Combination Cost Study.

When computing the costs of DS3 Dedicated Transport Non-Collocated, the Company cost studies indicate that the work performed by its four provisioning work groups is identical to the work performed by these same four groups when installing a Stand Alone DS3 loop, with one exception.<sup>54</sup>

In the case of a Stand Alone DS3 loop, the FOG group must

\*\*\*XXXXXXXXXXXXXXXXXXXXXXXXXXXX\*\*\*, while in the case of DS3

Dedicated Transport Non-Collocated the FOG group must

\*\*\*XXXXXXXXXXXXXXXXXXXXXXXXXXXX\*\*\* 55

\*\*\*XX

[illegible]

is that the single cost difference listed by the Company between installation of a Stand Alone DS3 loop and installation of DS3 Dedicated Transport Non-Collocated is that FOG performs exactly twice as much work in the case of DS3 Dedicated Transport Non-Collocated.

The Company also provides both Stand Alone DS1 loops and DS1 Dedicated Transport Non-Collocated. Absent evidence to the contrary, based on analysis of the Company's DS3 cost estimation, I would expect that the single cost difference listed by the Company between installation

<sup>54</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 6.2 and SBC Illinois Ex. 6.0, Schedule CFC-1, TAB 6.3.

55 SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 6.2 and SBC Illinois Ex. 6.0, Schedule CFC-1, TAB 6.3.

of a Stand Alone DS1 loop and installation of DS1 Dedicated Transport Non-Collocated is that FOG performs exactly twice as much work in the case of DS1 Dedicated Transport Non-Collocated. However, this is not the case.

In contrast to the DS3 comparison, the Company estimates that the SSC group must perform work more often when provisioning DS1 Dedicated Transport Non-Collocated than when provisioning Stand Alone DS1 loops.<sup>57</sup> That is, the SSC task occurrence factor for **XXXXXXXXXXXXXXX\*\*\*** is **\*\*\*XXXXXXXXXXXXXXX\*\*\*** for provisioning of DS1 Dedicated Transport Non-Collocated, but only **\*\*\*XXXXXX\*\*\*** for provisioning of Stand Alone DS1 loops. This difference is unsupported and, based on a comparison between DS1 and DS3 provisioning cost estimates, appears to be erroneous.

**Q. Have you identified any other deficiencies in the methodology used by the Company to estimate EEL Dedicated Transport costs?**

A. Yes. As explained above, the 2 year location life assumed by the Company for its Nonrecurring EEL Combination Cost Study is unsupported by the Company. In fact, the evidence provided by the Company provides even less support for a two year EEL Dedicated Transport location life than it does for a two year EEL Loop location life.

---

<sup>56</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 6.2.

1013 For instance, even if customer churn means that a CLEC will relinquish an  
1014 individual customer loop, it does not imply that the CLEC will relinquish  
1015 Dedicated Transport serving that customer, particularly when the  
1016 Dedicated Transport DS1 or DS3 serves aggregated traffic from multiple  
1017 customers. The Company response to Staff Data Request JZ 1.14,  
1018 referenced above as Sched. 7.02, indicates that the Company has utterly  
1019 failed to account for this fact. Again, this failure will increase Dedicated  
1020 Transport cost estimates.

1021

1022 **Q. What adjustment should the Commission make with respect to the**  
1023 **EEL Dedicated Transport cost estimates?**

1024 A. If the Company cannot provide credible support for the differences  
1025 between the activities performed by SSC group when provisioning DS1  
1026 Dedicated Transport Non-Collocated and when provisioning Stand Alone  
1027 DS1 loops, I recommend the Commission require the Company to  
1028 calculate DS1 Dedicated Transport Non-Collocated cost estimates  
1029 assuming the activities performed by SSC when provisioning DS1  
1030 Dedicated Transport Non-Collocated are identical to those performed by  
1031 SSC when provisioning Stand Alone DS1 loops.

1032

1033 If the Company cannot provide credible support for its 2-year location life  
1034 assumption or provide a credibly supported revised location life applicable

---

<sup>57</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 6.2 and SBC Illinois Ex. 6.0, Schedule CFC-1, TAB 6.3.

1035 to its EEL Dedicated Transport offerings, then I recommend that the  
1036 Commission require the Company to exclude disconnect costs from the  
1037 development of its EEL Dedicated Transport cost estimate.  
1038

1039 *Central Office Multiplexing Costs*  
1040

1041 **Q. Please explain the Company's general approach to estimation of**  
1042 **Central Office Multiplexing costs.**

1043 A. The Company provides for two general types of multiplexing: DS1 to Voice  
1044 and DS3 to DS1.<sup>58</sup> In its cost development the Company develops a  
1045 stand-alone cost for DS1 to Voice multiplexing but includes the costs of  
1046 DS3 to DS1 multiplexing in the development of its DS3 Dedicated  
1047 Transport cost estimates.  
1048

1049 **Q. What workgroups perform the activities the Company lists in support**  
1050 **of its DS1 to Voice Multiplexing cost estimates?**

1051 A. In support of its DS1 to Voice Multiplexing cost estimates, the company  
1052 lists the activities of three groups: the Hi-Cap Provisioning Center (HPC),  
1053 the Field Operations Group (FOG), and the SSC (Special Services  
1054 Center).  
1055

---

<sup>58</sup> See, for example, SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 1.10.

1056 **Q. Are the activities performed by these workgroups necessary**  
1057 **assuming the lowest cost network configuration and most efficient**  
1058 **telecommunications technology available?**

1059 A. The Company has not demonstrated that the activities it lists in support of  
1060 its DS1 to Voice - Central Office Multiplexing costs are those activities that  
1061 would be necessary assuming the lowest cost network configuration and  
1062 most efficient telecommunications technology available. Furthermore, the  
1063 evidence in this proceeding suggests that a number of the activities listed  
1064 in support of the Central Office Multiplexing cost estimates may not be  
1065 necessary or may be performed more efficiently than is assumed in the  
1066 Company's Nonrecurring New EEL Combination Cost Study.

1067

1068 **Q. Please describe the evidence suggesting that activities listed in**  
1069 **support of the DS1 to Voice - Central Office Multiplexing cost**  
1070 **estimates may not be necessary or may be performed more**  
1071 **efficiently than is assumed in the Company's Nonrecurring New EEL**  
1072 **Combination Cost Study.**

1073 A. As indicated above, the Company appears to incorporate the cost of DS1  
1074 to DS3 Central Office Multiplexing into its DS3 Interoffice Dedicated  
1075 Transport cost computations. Presumably the same three groups that  
1076 provision Voice to DS1 Central Office Multiplexing also provision DS1 to  
1077 DS3 Central Office Multiplexing. When estimating the costs of the DS3  
1078 Interoffice Dedicated Transport component of an EEL, the Company cost

development assumes that these groups perform both multiplexing and interoffice dedicated transport provisioning simultaneously.<sup>59</sup> However, when estimating the cost of provisioning a DS1 Interoffice Dedicated Transport component of an EEL, the Company cost development assumes that the three provisioning groups perform multiplexing and interoffice dedicated transport provisioning independently. In developing independent cost estimates, the Company has listed identical activities both in support of DS1 Interoffice Dedicated Transport and Voice to DS1 Central Office Multiplexing cost estimates, but has not demonstrated that such activities need to be performed twice.

For example, the tasks performed by the HPC group listed in support of the Voice to DS1 Central Office Multiplexing cost estimates mirror line for line the tasks performed by the HPC group listed in support of the DS1 Interoffice Dedicated Transport cost estimates.<sup>60</sup> Similarly, the tasks performed by the FOG and SSC groups listed in support of the Voice to DS1 Central Office Multiplexing cost estimates are listed among those performed by these groups listed in support of the DS1 Interoffice Dedicated Transport cost estimates.<sup>61</sup>

In some instances these activities clearly do not need to be performed twice. For example, when provisioning DS1 Interoffice Dedicated

---

<sup>59</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 6.2 Lns 199-204 and 222-227.

<sup>60</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 6.2.

1101 Transport in combination with Voice to DS1 Central Office Multiplexing the  
1102 Company claims that the FOG group travels to an unmanned office twice:  
1103 once to provision the interoffice dedicated transport and then again to  
1104 provision the multiplexing. This is a gross example of inefficiency, and the  
1105 complete redundancy in tasks listed suggests that all of Central Office  
1106 Multiplexing tasks are duplicative. This conclusion is supported by the fact  
1107 that the similar tasks are listed only once for the combination of DS3  
1108 Interoffice Dedicated Transport and DS1 to DS3 Central Office  
1109 Multiplexing.

1110

1111 **Q. Have you identified any other deficiencies in the methodology used**  
1112 **by the Company to estimate Central Office Multiplexing – DS1 to**  
1113 **Voice costs?**

1114 A. Yes. As explained above, the 2 year location life assumed by the  
1115 Company is unsupported by the Company. This unsupported assumption  
1116 yields, as it does for the EEL Loop Connection cost estimate, an  
1117 unsupported increase in the Central Office Multiplexing – DS1 to Voice  
1118 cost estimate.

1119

1120 **Q. What adjustment would you recommend the Commission make with**  
1121 **respect to the Central Office Multiplexing – DS1 to Voice cost**  
1122 **estimate?**

---

<sup>61</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 6.2.

1123 A. The costs associated with this function appear to be already included with  
1124 the estimated costs of DS1 Interoffice Dedicated Transport. If the  
1125 Company cannot provide credible support to indicate that these costs are  
1126 not entirely duplicative and cannot revise its estimates to appropriately  
1127 capture costs associated with any non-duplicative activities, I recommend  
1128 that the Commission require the Company to exclude the separate Central  
1129 Office Multiplexing – DS1 to Voice cost estimate from its Nonrecurring  
1130 New EEL Combination Cost Study.

1131

1132 *Clear Channel Capability Costs*

1133

1134 **Q. What is Clear Channel Capability?**

1135 A. The Company's New EEL Combination Cost Study describes clear  
1136 channel capability as:

1137 ...a feature that provide the customer an increased usable  
1138 bandwidth of 1.536 Mbps from 1.344 Mbps of an unconstrained  
1139 data stream across the network.<sup>62</sup>  
1140

1141 **Q. Please explain the Company's general approach to estimation of**  
1142 **Clear Channel Capability costs.**

1143 A. The activities required to provision Clear Channel Capability are included  
1144 among the activities required to provision a DS1 loop. The Company,  
1145 however, provides a separate cost estimate for instances when it must

---

<sup>62</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 1.

1146 provision Clear Channel Capability on an existing DS1 that does not have  
1147 Clear Channel Capability.<sup>63</sup>

1148

1149 **Q. What workgroups perform the activities the Company lists in support**  
1150 **of its Clear Channel Capability cost estimates?**

1151 A. In support of the Clear Channel Capability cost estimates, the Company  
1152 lists activities performed by both the Hi-Cap Provisioning Center (HPC)  
1153 and the Special Services Center (SSC).

1154

1155 **Q. Are the activities performed by these workgroups necessary**  
1156 **assuming the lowest cost network configuration and most efficient**  
1157 **telecommunications technology available?**

1158 A. The Company has not demonstrated that the activities it lists in support of  
1159 its Clear Channel Capability costs are those activities that would be  
1160 necessary assuming the lowest cost network configuration and most  
1161 efficient telecommunications technology available. Furthermore, the  
1162 evidence in this proceeding suggests that at least one of the activities  
1163 listed in support of the Clear Channel Capability cost estimates might be  
1164 performed more efficiently than is shown in the Company's Nonrecurring  
1165 New EEL Combination Cost Study.

1166

1167 **Q. Please describe the evidence that suggests that provisioning of**  
1168 **Clear Channel Capability may be performed more efficiently than is**

---

<sup>63</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 1.

1169           **shown in the Company's Nonrecurring New EEL Combination Cost**  
1170           **Study.**

1171       A.     One of the tasks performed by SSC in provisioning Clear Channel  
1172           Capability is **\*\*\*XXXXXXXXXXXXXXXX\*\*\***, which according to the  
1173           Company's estimates takes **\*\*\*XXXXXXX\*\*\***.<sup>64</sup> However, when  
1174           developing the estimate of the 4-Wire DS1 Digital Loop Connection cost  
1175           the Company indicates that this task takes only **\*\*\*XXXXXXX\*\*\***.<sup>65</sup>

1176

1177       **Q.     What adjustment should the Commission make with respect to the**  
1178           **Clear Channel Capability cost estimate?**

1179       A.     If the Company cannot provide credible support to indicate that the timing  
1180           of the **\*\*\*XXXXXXXXXXXXXXXX\*\*\*** used for purposes of computation of  
1181           Clear Channel Capability cost estimates differs from the timing of the  
1182           **\*\*\*XXXXXXXXXXXXXXXX\*\*\*** used for purposes of computation of the 4-  
1183           Wire Digital Loop Connection cost estimates, the Company should be  
1184           required to reduce its **\*\*\*XXXXXXXXXXXXXXXX\*\*\*** activity time estimate to  
1185           **\*\*\*XXXXXX\*\*\***.<sup>66</sup>

1186

1187       *Findings and Recommendations*

1188

---

<sup>64</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 6.2, Ln 472.

<sup>65</sup> SBC Illinois Ex. 6.0, Schedule CFC-2, TAB 6.2, Ln 182.

<sup>66</sup> This reduction should occur for both initial and additional activities.

1189 **Q. Please summarize your analysis of the Nonrecurring New EEL**  
1190 **Combination Cost Study and your recommendation with respect to**  
1191 **the Company's proposed cost estimates.**

1192 A. The Company has not demonstrated that the activities listed in support of  
1193 its New EEL Combination Cost Study are necessary assuming, as the  
1194 FCC requires, the lowest cost network configuration and most efficient  
1195 telecommunications technology available. The evidence in this  
1196 proceeding suggests that in a number of cases provisioning of service  
1197 may be performed more efficiently than is assumed in the Company's  
1198 Nonrecurring New EEL Combination Cost Study. The Company has also  
1199 made unsupported assumptions regarding location lives that yield  
1200 unsupported increases in its cost estimates. Based on this evidence, I  
1201 make the following recommendations.

1202

1203 With respect to Loop Connection cost estimates, if the Company cannot  
1204 provide credible support for the differences between its proposed EEL  
1205 Combination Loop Connection cost estimate and its Stand Alone Loop  
1206 Connection cost estimate or provide supportable revised estimates, I  
1207 recommend that the Commission require the Company to replace its EEL  
1208 Combination Loop Connection cost estimates with the comparable Stand

1209 Alone Loop Connection cost estimates approved by the Commission in  
1210 this proceeding.<sup>67</sup>

1211

1212 With respect to Dedicated Transport cost estimates, if the Company  
1213 cannot provide credible support for the differences between the activities  
1214 performed by SSC group when provisioning DS1 Dedicated Transport  
1215 Non-Collocated and when provisioning Stand Alone DS1 loops, I  
1216 recommend the Commission require the Company to calculate DS1  
1217 Dedicated Transport Non-Collocated costs assuming the activities  
1218 performed by SSC when provisioning DS1 Dedicated Transport Non-  
1219 Collocated are identical to those performed by SSC when provisioning  
1220 Stand Alone DS1 loops.

1221

1222 Furthermore, if the Company cannot provide credible support for its 2-year  
1223 location life assumption or provide a credibly supported revised location  
1224 life applicable to its EEL Dedicated Transport offerings, I recommend that  
1225 the Commission require the Company to exclude disconnect costs from  
1226 the development of its EEL Dedicated Transport cost estimate.

1227

1228 With respect to Central Office Multiplexing – DS1 to Voice costs, the costs  
1229 associated with this function appear to be already included with the  
1230 estimated costs of DS1 Interoffice Dedicated Transport. If the Company

---

<sup>67</sup> My recommendations to correct disconnect portion of the Stand Alone Loop Connection charge will, if EEL Loop Connection charges mirror Stand Alone Loop Connection charges, address the

1231 cannot provide credible support to indicate that these costs are not entirely  
1232 duplicative and cannot revise its estimates to appropriately capture costs  
1233 associated with any non-duplicative activities, I recommend that the  
1234 Commission require the Company to exclude the separate cost estimate  
1235 for Central Office Multiplexing – DS1 to Voice from its Nonrecurring New  
1236 EEL Combination Cost Study.

1237

1238 With respect to Clear Channel Capability costs, if the Company cannot  
1239 provide credible support to indicate that the timing of the  
1240 \*\*\*XXXXXXXXXX\*\*\* used for purposes of computation of Clear Channel  
1241 Capability costs differs from the timing of the \*\*\*XXXXXXXXXXXXXXXXXX  
1242 X\*\*\* used for purposes of computation of the 4-Wire Digital Loop  
1243 Connection costs, the Company should be required to reduce its  
1244 \*\*\*XXXXXXXXXX\*\*\* activity time estimate to \*\*\*XXXXXXXXXX\*\*\*.

1245

1246 ***Nonrecurring Unbundled Loop Cost Study***

1247

1248 *Overview*

1249

1250 **Q. What is a UNE-P combination?**

1251 A. Combinations of Unbundled Loops and Unbundled Local Switching with  
1252 Shared Transport are generally referred to as the Unbundled Network

---

deficiencies I have identified with respect to disconnect portion of EEL Loop Connection charges.

1253 Elements Platform (UNE-P).<sup>68</sup> The Company UNE-P tariff differentiates  
1254 between Pre-Existing and New UNE-P combinations, stating:

1255 Pre-Existing ("Currently combined") is the situation when a  
1256 telecommunications carrier orders all the Ameritech  
1257 Unbundled Network Elements required to provide service to  
1258 and convert a Company end-user customer, another  
1259 telecommunications carrier's pre-existing UNE-P enduser  
1260 customer, or a telecommunications carrier's resale end-user  
1261 customer to a pre-existing UNE-P (a) without any change in  
1262 features or functionality that was being provided by the  
1263 Company (or by telecommunications carrier on a resale  
1264 basis) at the time of the order and/or (b) with only the  
1265 change needed to route the end user customer's operator  
1266 service and directory assistance (OS/DA) calls to the  
1267 telecommunications carrier's OS/DA platform via customized  
1268 routing where such customized routing has already been  
1269 established to the telecommunications carrier's OS/DA  
1270 platform from the relevant Company.

1271  
1272 A New UNE-P combination of network elements as provided  
1273 under this Section is the situation when a  
1274 telecommunications carrier requests the Company to provide  
1275 a combination of network elements of the same type (i.e.,  
1276 unbundled loop and unbundled local switching port with  
1277 shared transport) that the Company ordinarily combines to  
1278 provide service for its end users, as delineated in this  
1279 Section. The New UNE-P combination of unbundled network  
1280 elements, as described above, is not "currently physically  
1281 combined" as that term is defined herein.<sup>69</sup>  
1282

1283  
1284 The Company further delineates between Plain Old Telephone Service  
1285 (POTS) UNE-P combinations and Non-POTS UNE-P Combinations,  
1286 presumably based on the switch port included as part of the UNE-P  
1287 combination. SBC Illinois witness Dr. Kent Currie indicates that "POTS  
1288 ports include basic analog line ports and ground start ports" and that "Non-

---

<sup>68</sup> ILL. C.C. No. 20, Part 19, Section 15, 7<sup>th</sup> Revised Sheet No. 1.

1289 POTS ports include PBX ground start line ports, basic Centrex line ports,  
1290 DID ports, ISDN Direct ports, ISDN Prime ports, ADTS ports, digital trunk  
1291 ports, Centrex EKL ports, Centrex Attendant ports, and Centrex ISDN  
1292 ports.”<sup>70</sup>

1293

1294 **Q. What is a Stand Alone Loop?**

1295 A. The Company’s Nonrecurring Unbundled Loop Cost Study describes a  
1296 Stand Alone Loop as an unbundled loop that connects an end-user to  
1297 CLEC collocation cage.<sup>71</sup> The Company does not, as it does with respect  
1298 to UNE-P configurations, differentiate between POTS Stand Alone Loops  
1299 and Non-POTS Stand Alone Loops. The Company does, however,  
1300 differentiate between DS1 Stand Alone, DS3 Stand Alone, and other  
1301 (analog and 2-wire digital) Stand Alone Loops.<sup>72</sup>

1302

1303 **Q. Please explain how the Company’s Stand Alone and UNE-P loop**  
1304 **provisioning cost estimates are structured?**

1305 A. There are three cost estimates included in the Company’s Nonrecurring  
1306 Unbundled Loop Cost Study: (1) Line Connection costs (2) DS1 costs, (3)  
1307 and DS3 costs. As stated in the Company’s Nonrecurring Unbundled  
1308 Loop Cost Study “[t]he Line Connection Charge is a blending of 2 types of  
1309 POTS line connections, a Stand Alone and a UNE-P POTS New

---

<sup>69</sup> ILL. C.C. No. 20, Part 19, Section 15, 5<sup>th</sup> Revised Sheet No. 2.

<sup>70</sup> SBC Illinois Ex. 5.0 at 12, footnotes 2 and 3.

<sup>71</sup> Nonrecurring Unbundled Loop Cost Study, TAB 1.

<sup>72</sup> See SBC Illinois Ex. 3.0 at 7.

1310 Combination Loop.”<sup>73</sup> The DS1 cost is the Company’s estimate of the  
1311 cost for connecting both Stand Alone DS1 loops and of DS1 loops that are  
1312 part of UNE-P combinations.<sup>74</sup> The DS3 cost is the Company’s estimate  
1313 of the cost of connecting Stand Alone DS3 loops.<sup>75</sup>

1314

1315 *POTS, DS1, and DS3 Stand-Alone Line Connection Costs*  
1316

1317 **Q. Have you identified any deficiencies in the methodology used by the**  
1318 **Company to estimate POTS, DS1, and DS3 Stand-Alone Line**  
1319 **Connection costs?**

1320 A. Yes. I have identified two deficiencies in the Company’s Stand-Alone Line  
1321 Connection cost estimation methodology. First, as it does for new EEL  
1322 combinations the Company assumes that the location lives of Stand-Alone  
1323 lines is 2 years.<sup>76</sup> As is the case for the EEL Loop Connection cost, the  
1324 Stand-Alone Loop Connection cost is a strictly decreasing function of  
1325 assumed location life. Therefore, if the location life assumed is shorter  
1326 than the average forward looking location life, the Company’s Stand Alone  
1327 Line Connection cost estimates will be overstated. Therefore, the  
1328 unsupported assumption that term length for CLEC customers are shorter

---

<sup>73</sup> Nonrecurring Unbundled Loop Cost Study, TAB 1.

<sup>74</sup> SBC Illinois Witness Cass states “[i]n the case of DS1 and DS3 loops there is no need to identify separate costs for UNE-P and stand-alone because the cost of establishing these loops does not vary by scenario.” SBC Illinois Ex. 6.0 at 22.

<sup>75</sup> SBC Illinois Ex. 3.0 at 7.

<sup>76</sup> SBC Illinois Ex. 6.0, CFC-1, TAB 1.

1329 than the term lengths presumably experienced by the Company, yields an  
1330 unsupported increase in the EEL Loop Connection cost estimate.

1331

1332 Second, the Company fails to account for customer migrations when  
1333 developing the Stand Alone Line Connection cost DIP rate. That is, the  
1334 Company assumes that Stand Alone Line Connections are comparable to  
1335 new UNE-P line connections when developing the Stand Alone DIP rate.  
1336 However, a portion of Stand Alone Line Connections will be comparable to  
1337 existing UNE-P. That is, in many instances when a CLEC orders a stand  
1338 alone loop, the Company will need to do the work to change an existing  
1339 DIPed and DOPed loop into a stand alone loop. In such instances, the  
1340 Company may need to change the cross connect configuration in the  
1341 central office, but it should not need to perform the outside plant cross  
1342 connects.

1343

1344 **Q. What adjustment should the Commission make with respect to**  
1345 **POTS, DS1, and DS3 Stand-Alone Line Connection costs?**

1346 A. If the Company cannot provide credible support for its 2 year location life  
1347 assumption or provide a credibly supported revised location life estimate, I  
1348 recommend that the Commission require the Company to calculate the  
1349 location life for each loop type based upon the average location life of the  
1350 Company's comparable end-user offerings.<sup>77</sup>

---

<sup>77</sup> See the Direct Testimony of Staff Witness Hanson, ICC Staff Ex. 6.0, for a discussion of Company location lives.

1351

1352 If the Company cannot provide credible support for the DIP rate it applies  
1353 to stand alone loops when estimating its Stand Alone Line Connection  
1354 cost or provide a credibly supported revised DIP rate for this purpose, I  
1355 recommend that the Commission require the Company to provide  
1356 separate new UNE-P and Stand Alone CP&M estimates in the  
1357 development of its Line Connection costs. In addition, when developing  
1358 the CP&M estimate for the Stand Alone Line Connection cost the  
1359 Company should use a work group occurrence factor of **\*\*\*XXXX\*\*\*** or, in  
1360 the event a different DIP factor is adopted in this proceeding, **\*\*\*XXXXX\*\*\***  
1361 times (1 - the DIP factor adopted in this proceeding).

1362

1363 **Q. How do you compute the **\*\*\*XXXXX\*\*\*** CP&M work group occurrence**  
1364 **factor you propose for use in the development of the Stand Alone**  
1365 **Line Connection cost estimate?**

1366 **A.** For the period starting in April of 2002 and ending in November of 2002,  
1367 **\*\*\*XXXXX\*\*\*** of POTS UNE-P lines ordered were existing customer lines  
1368 that did not require the Company's CP&M group to physically install cross-  
1369 connect wiring.<sup>78</sup> Of the remaining POTS UNE-P lines ordered,  
1370 **\*\*\*XXXXX\*\*\*** were not existing customer lines. The Company estimates  
1371 that **\*\*\*XXXXXX\*\*\*** of orders for new UNE-P lines do require the CP&M  
1372 group to physically install cross-connect work. Based on these figures,

---

<sup>78</sup> Response to Attorney General Data Request No. 2.7e, Attachment "Analysis of Stand-Alone and UNE-P Loop Orders for SBC Illinois," Attached as Sched. 7.03.

1373 the CP&M group physically installs cross-connect work only  
1374 \*\*\*XXXXXXXXXXXXXXXXXXXX\*\*\* of the time in provisioning POTS UNE-  
1375 P lines. Thus, the \*\*\*XXXX\*\*\* CP&M work group occurrence factor I  
1376 propose for development of the Stand Alone Line Connection cost  
1377 estimate equals the estimated CP&M work group occurrence factor  
1378 applicable to provisioning of all POTS UNE-P lines including both  
1379 provisioning of new-UNE-P lines and UNE-P migrations.

1380

1381 *New POTS and DS1 UNE-P Line Connection Costs*

1382

1383 **Q. Have you identified any deficiencies in the methodology used by the**  
1384 **Company to estimate New POTS and DS1 UNE-P Line Connection**  
1385 **costs?**

1386 A. Yes. The Company again makes the unsupported assumption that the  
1387 location lives of New UNE-P lines is 2 years. In addition, the Company  
1388 assumes that, with respect to UNE-P POTS loop connections, UNE-P  
1389 loop disconnect work at the central office is required the same percentage  
1390 of the time that it is required when the Company performs installation of  
1391 new UNE-P loops. This assumption is not supported with credible  
1392 evidence.

1393

1394 Churn will, in some cases, result in customers migrating from one CLEC  
1395 using UNE-P to another CLEC using UNE-P or back to the Company. In

1396 these cases, the Company presumably will not perform the disconnect  
1397 activity. The Company has provided no evidence to indicate that it  
1398 accounted for these instances when developing its disconnection work  
1399 group occurrence factors.

1400

1401 At the end of 2001, 8.6% of POTS lines were provisioned over either  
1402 CLEC facilities or over CLEC facilities in combination with ILEC loops.<sup>79</sup>  
1403 Alternatively, 91.4% of POTS lines were provisioned over ILEC facilities  
1404 either as ILEC retail lines, as ILEC UNE-P lines provided to CLECs, or as  
1405 ILEC resold lines provided to CLECs. Based on these figures, it is likely  
1406 that customer churn will, in a high percentage of instances, result in  
1407 customers migrating from one CLEC using UNE-P to another CLEC using  
1408 UNE-P or back to the Company.

1409

1410 **Q. What adjustment should the Commission make with respect to POTS**  
1411 **and DS1 UNE-P Line Connection cost estimates?**

1412 A. If the Company cannot provide credible support for its 2 year location life  
1413 assumption or provide a credibly supported revised location life estimate, I  
1414 recommend that the Commission require the Company to calculate the  
1415 location life for each loop type based upon the average location life of the  
1416 Company's comparable end-user offerings.<sup>80</sup>

---

<sup>79</sup> See Illinois Commerce Commission, Annual Report on Telecommunications Markets in Illinois, Wednesday, October 23, 2002, at 3.

<sup>80</sup> See the Direct Testimony of Staff Witness Hanson, ICC Staff Ex. 6.0, for a discussion of Company location lives.

1417

1418           Additionally, if the Company cannot provide credible support for its work  
1419           group occurrence factors, the Commission should require the Company to  
1420           use occurrence factors when computing POTS UNE-P disconnect costs  
1421           that equal  $(1 - \text{the DIP rate adopted in this proceeding}) \times 0.086$ .<sup>81</sup> This  
1422           computation assumes that 91.4% of POTS UNE-P terminations result in  
1423           transfers of POTS UNE-P lines to another UNE-P provider or back to the  
1424           Company and further that the Company only disconnects a fraction equal  
1425           to  $(1 - \text{whatever DIP rate is adopted in this proceeding})$  of those lines that  
1426           are not migrated to another provider or back to the Company.

1427

1428   *Findings and Recommendations*

1429

1430   **Q.    Please summarize your analysis of the Nonrecurring Unbundled**  
1431           **Loop Cost Study and your recommendation with respect to the**  
1432           **Company's proposed cost estimates.**

1433   A.    The Company has not provided credible support for its assumptions  
1434           regarding location lives. Based on this evidence, I make the following  
1435           recommendations.

1436

1437           With respect to POTS, DS1 and DS3 Stand Alone Line Connection cost  
1438           estimates and POTS and DS1 UNE-P Line Connection cost estimates, if

1439 the Company cannot provide credible support for its 2 year location life  
1440 assumption or provide a credibly supported revised location life estimate, I  
1441 recommend that the Commission require the Company to calculate the  
1442 location life for each loop type based upon the average location life of the  
1443 Company's comparable end-user offerings.<sup>82</sup>

1444

1445 Additionally, if the Company cannot provide credible support for its work  
1446 group occurrence factors, the Commission should require the Company to  
1447 use occurrence factors when computing POTS UNE-P disconnect costs  
1448 that equal  $((1 - \text{the DIP rate adopted in this proceeding}) \times 0.086)$ .<sup>83</sup>

1449

1450 ***Nonrecurring Unbundled Local Switching - Ports Study***

1451

1452 *Overview*

1453

1454 **Q. What is unbundled local switching ("ULS")?**

1455 A. The Company's cost documentation states:

1456 Unbundled Local Switching (ULS) provides unbundled access to  
1457 SBC – Ameritech's End Office switches, including switch features  
1458 and functions. With ULS, the individual unbundled loops of  
1459 Competitive Local Exchange Carriers (CLECs) can connect to  
1460 Ameritech's end offices. ULS also provides unbundled access on a

---

<sup>81</sup> Specifically this adjustment would be applied to all work group occurrence factors listed for FOG with respect to disconnect activities listed in support of the UNE-P POTS New Combination Loop on TAB 6.3 of SBC Illinois Ex. 6.0, CFC-1.

<sup>82</sup> See the Direct Testimony of Staff Witness Hanson, ICC Staff Ex. 6.0, for a discussion of Company location lives.

<sup>83</sup> Specifically this adjustment would be applied to all work group occurrence factors listed for FOG with respect to disconnect activities listed in support of the UNE-P POTS New Combination Loop on TAB 6.3 of SBC Illinois Ex. 6.0, CFC-1.

1461 line-by-line basis to currently provided and/or technically feasible  
1462 functionality of that switch.<sup>84</sup>  
1463

1464 **Q. How does a CLEC obtain access to SBC Illinois provided ULS?**

1465 A. The Company's cost documentation states:

1466 SBC-Ameritech offers unbundled access to local switching through  
1467 line-side and trunk-side ports.<sup>85</sup>  
1468

1469 *Line and Trunk Port Non-recurring Costs*  
1470

1471 **Q. Have you identified any deficiencies in the methodology used by the**  
1472 **Company to estimate Port Non-Recurring Costs?**

1473 A. Yes. The Company again makes the unsupported assumption that the  
1474 location lives of ports used in combinations is 2 years.<sup>86</sup>  
1475

1476 **Q. What adjustment should the Commission make with respect to Port**  
1477 **Non-Recurring cost estimates?**

1478 A. If the Company cannot provide credible support for its 2 year location life  
1479 assumption or provide a credibly supported revised location life estimate, I  
1480 recommend that the Commission require the Company to calculate the

---

<sup>84</sup> SBC Illinois Ex. 7.0, Schedule DJB-04, Attachment to TAB 1.0.

<sup>85</sup> SBC Illinois Ex. 7.0, Schedule DJB-04, Attachment to TAB 1.0.

<sup>86</sup> I note that SBC Illinois Witness Barch indicates that the location lives assumed for ports is three years. SBC Illinois Ex. 7.0 at 69. I assume, based on the fact that cost study documentation indicates that the location lives assumed for ports is two years, that Mr. Barch's statement represents a typographical error. SBC Illinois Ex. 7.0, Schedule DJB-04, Attachment to TAB 1.0.

1481 location life for each port based upon the average location life of the  
1482 Company's comparable end-user offerings.<sup>87</sup>

1483

1484 *Findings and Recommendations*

1485

1486 **Q. Please summarize your analysis of the Nonrecurring Unbundled**  
1487 **Loop Switching – Ports Study and your recommendation with**  
1488 **respect to the Company's proposed cost estimates.**

1489 A. The Company has not provided credible support for its assumptions  
1490 regarding location lives. Based on this evidence, I make the following  
1491 recommendations.

1492

1493 With respect to Non-recurring Line and Trunk Port costs, if the Company  
1494 cannot provide credible support for its 2 year location life assumption or  
1495 provide a credibly supported revised location life estimate, I recommend  
1496 that the Commission require the Company to calculate the location life for  
1497 each loop type based upon the average location life of the Company's  
1498 comparable end-user offerings.<sup>88</sup>

1499

1500 ***Nonrecurring Unbundled Port Features Study***

1501

---

<sup>87</sup> See the Direct Testimony of Staff Witness Hanson, ICC Staff Ex. 6.0, for a discussion of Company location lives.

<sup>88</sup> See the Direct Testimony of Staff Witness Hanson, ICC Staff Ex. 6.0, for a discussion of Company location lives.

1502 *Overview*

1503

1504 **Q. When does the Company propose to assess the Port Feature**  
1505 **Add/Change Translation Rate?**

1506 A. The Company proposes to assess the Port Feature Add/Change  
1507 Translation Rate when a CLEC requests the addition of a feature or a  
1508 change to a feature of an existing port configuration.<sup>89</sup> Based on rate  
1509 application examples provided by SBC Illinois witness Silver, the  
1510 add/change translation rate is only assessed by the Company when a  
1511 CLEC requests the addition of a feature or a change to a feature of an  
1512 existing port configuration.<sup>90</sup> CLECs will not be assessed this rate when a  
1513 Port is configured for the first time, that is, when ordering new UNE-P  
1514 combinations.<sup>91</sup> They will, however, be assessed this rate when ordering  
1515 conversions, even when they request conversions of existing circuits with  
1516 no change in features (i.e, when they request conversions “as is”).<sup>92</sup>

1517

1518 **Q. Has the Company included both the costs of connecting features**  
1519 **and the costs of disconnecting features in computing its estimated**  
1520 **Port Feature Add/Change Translation Cost?**

1521 A. Yes. In including the disconnect portion of the cost, the Company  
1522 assumed a two year location life.<sup>93</sup>

---

<sup>89</sup> SBC Illinois Ex. 7.0, Schedule DJB-05, Attachment to TAB 1.0.

<sup>90</sup> SBC Illinois Ex. 3.0, Schedule MDS-10, Page 4 of 14.

<sup>91</sup> SBC Illinois Ex. 3.0, Schedule MDS-10, Page 5 of 14.

<sup>92</sup> SBC Illinois Ex. 3.0, Schedule MDS-10, Page 1 of 14.

<sup>93</sup> SBC Illinois Ex. 7.0, Schedule DJB-05, Attachment to TAB 1.0.

1523

1524 *Port Feature Add/Change Translation Costs*

1525

1526 **Q. Have you identified any deficiencies in the methodology used by the**  
1527 **Company to estimate Port Feature Add/Change Translation Costs?**

1528 A. Yes. The Company makes the unsupported assumption that the location  
1529 lives of port features equals the location lives of port itself.<sup>94</sup> The  
1530 Company, consequently, assumes that it will be disconnecting a port and  
1531 rearranging the features on the port at the same time. Presumably, the  
1532 Company will not need to disconnect port features if it is disconnecting the  
1533 port itself. Therefore, the disconnect activities included within the Port  
1534 Feature Add/Change Translation cost estimate appear to be wholly  
1535 redundant.

1536

1537 Second, the Company estimates that it costs **\*\*\*XXXXX\*\*\*** to connect a  
1538 basic analog line port that is part of a New UNE-P configuration regardless  
1539 of the number of features requested. However, the Company assumes  
1540 that it costs **\*\*\*XXX\*\*\*** to connect the initial feature and **\*\*\*XXXX\*\*\*** to  
1541 connect additional features when it adds/changes features on an existing  
1542 port. The Company, thus, estimates that it is always at least as costly  
1543 and, when more than one feature is effected, is considerably more costly  
1544 to add or change features than it is to obtain a brand new port as part of a  
1545 New UNE-P configuration. Because the Company would presumably

1546 have to do all of the work necessary to add features to New UNE-P  
1547 configurations, this evidence suggests that the Company is able to  
1548 provision features more efficiently than its Nonrecurring Unbundled Port  
1549 Features Study indicates.

1550

1551 **Q. What adjustment should the Commission make with respect to Port**  
1552 **Feature Add/Change Translation Costs?**

1553 A. Unless the Company can provide evidence that demonstrates that the  
1554 disconnect activities are necessary, the Commission should reject the  
1555 Company's inclusion of disconnect activity costs in its Port Feature  
1556 Add/Change Translation Costs. Furthermore, unless the Company can  
1557 demonstrate that the provisioning activities necessary to add/change a  
1558 port feature exceed the provisioning activities necessary to provision a  
1559 New UNE-P port, the Commission should require the Company to  
1560 estimate a single Port Feature Add/Change Translation cost (which  
1561 includes costs for both initial and additional adds/changes) equal to the  
1562 estimate of Line/Trunk Port costs for new combination orders.

1563

1564 *Findings and Recommendations*

1565

1566 **Q. Please summarize your analysis of the Nonrecurring Unbundled Port**  
1567 **Features Study and your recommendation with respect to the**  
1568 **Company's proposed cost estimates.**

---

<sup>94</sup> SBC Illinois Ex. 7.0, Schedule DJB-05, Attachment to TAB 1.0.

1569 A. The Company has not demonstrated that unbundled port features  
1570 disconnect activities are necessary given port disconnect activities  
1571 estimated elsewhere in the Company's filing. Furthermore, based on the  
1572 Company's port connection cost estimates, feature add/change translation  
1573 activities do not reflect least cost provisioning of port features.

1574

1575 Unless the Company can provide evidence that demonstrates that the  
1576 disconnect activities are necessary, the Commission should reject the  
1577 Company's inclusion of disconnect activity costs in its Port Feature  
1578 Add/Change Translation Costs. Furthermore, unless the Company can  
1579 demonstrate that the provisioning activities necessary to add/change a  
1580 port feature exceed the provisioning activities necessary to provision a  
1581 New UNE-P port, the Commission should require the Company to  
1582 estimate a single Port Feature Add/Change Translation cost (which  
1583 includes costs for both initial and additional adds/changes) equal to the  
1584 estimate of Line/Trunk Port costs for new combination orders.

1585

1586 **RECURRING LOOP COSTS**

1587

1588 ***Premises Termination Costs***

1589

1590 **Q. What specific recurring costs will you address in testimony?**

1591 A. I will discuss the premises termination component of recurring loop costs.  
1592 These costs are addressed and supported by SBC Illinois Witness  
1593 Smallwood.<sup>95</sup>  
1594

1595 **Q. When developing its residential premises termination unit**  
1596 **investment costs, what assumption does the Company make**  
1597 **regarding the configuration of residential terminations.**

1598 A. The Company assumes that “a residential loop requires a single premises  
1599 termination with a drop cable.”<sup>96</sup> That is, the Company assumes that each  
1600 residential premises is served by NID/Buried Drop Wire configuration with  
1601 a capacity of 6 pairs.<sup>97</sup>  
1602

1603 **Q. Does the Company’s approach account for multi-dwelling units?**

1604 A. No. Staff Data Request No. QL 1.05c(3), attached as Sched. 7.04,  
1605 requested the Company to  
1606

1607 ...clarify whether “multi-dwelling units” residential premises  
1608 terminations (e.g., terminations at apartment buildings and  
1609 condominiums) are counted for in LoopCAT.  
1610

1611 The Company responded “No.”<sup>98</sup>  
1612

---

<sup>95</sup> SBC Illinois Ex. 4.0.

<sup>96</sup> IL 2w Analog LoopCAT 02-05.xls!Premises\_Termination\_Res.

<sup>97</sup> Misc Material Cost 2002 (IL).xls.

<sup>98</sup> Response to Staff Data Request No. QL 1.05c(3), attached as Sched. 7.04.

1613 **Q. Will this omission result in cost estimates that are not, as the FCC**  
1614 **requires, based on the lowest cost network configuration and most**  
1615 **efficient telecommunications technology available?**

1616 A. Yes. The evidence in this proceeding suggests that when multiple lines  
1617 are terminated at the same physical location the Company can deploy  
1618 larger terminals, which reduce the unit cost per pair.<sup>99</sup> The Company  
1619 approach assumes, however, that residential customers are always  
1620 served by small terminals even when such customers reside in the same  
1621 physical location as other residential customers. Therefore, the Company  
1622 estimates are not based on the lowest cost network configuration and  
1623 most efficient telecommunications technology available as required by the  
1624 FCC.

1625

1626 **Q. What adjustment should the Commission make with respect to the**  
1627 **LoopCAT model in order to account for multi-unit residential**  
1628 **dwelling?**

1629 A. The Company has not proven that its residential premises termination cost  
1630 estimates are based on the lowest cost network configuration and most  
1631 efficient telecommunications technology available as required by the FCC.  
1632 Furthermore, the evidence in this proceeding suggests that the  
1633 Company's estimates are not based on the lowest cost network  
1634 configuration and most efficient telecommunications technology available  
1635 as required by the FCC. If the Company cannot provide credible support

1636 for its estimates or cannot adjust these estimates to properly reflect the  
1637 lowest cost network configuration and most efficient telecommunications  
1638 technology, I recommend that the residential and business percentages  
1639 input into the LoopCAT model be revised. I recommend that Percent  
1640 Residential Premises Termination be set equal to \*\*\*XXXXXX\*\*\* and  
1641 Percent Business Premises Termination be set equal to \*\*\*XXXXXX\*\*\*.

1642

1643 **Q. How do you compute this adjustment?**

1644 A. The U.S. Census Bureau reports that there are 4,883,649 housing units in  
1645 Illinois excluding the housing unit category Boat, RV, van, etc. and that  
1646 20.56% of these housing units are in structures that contain 5 or more  
1647 housing units.<sup>100</sup> Based on this information, I reclassified 20.56%  
1648 residential lines as business lines for the purposes of determining  
1649 percentage premises termination figures. This changed the percentage  
1650 residential and business premises figures, used by the Company to  
1651 estimate premises termination costs, respectively, from \*\*\*XXXXX\*\*\* and  
1652 \*\*\*XXXX\*\*\* to \*\*\*XXXX\*\*\* and \*\*\*XXXX\*\*\*.

1653

1654 **Q. Why did you employ a proxy based on census data to compute this**  
1655 **adjustment?**

1656 A. Staff requested data from the Company that would enable Staff to directly  
1657 calculate the number of housing units per residential structure. The

---

<sup>99</sup> IL Ww Analog LoopCAT 02-05.xls!Premises\_Termination\_Bus.

1658 Company did not, however, provide Staff with the requested  
1659 information.<sup>101</sup>

1660 *Findings and Recommendations*  
1661

1662 **Q. Please summarize your analysis of the Company's residential**  
1663 **premises termination cost estimates and your recommendation with**  
1664 **respect to the Company's proposed cost estimates.**

1665 A. If the Company cannot provide credible support for its premises  
1666 termination estimates or cannot adjust these estimates to properly reflect  
1667 the lowest cost network configuration and most efficient  
1668 telecommunications technology, I recommend that the residential and  
1669 business percentages input into the LoopCAT model be revised. I  
1670 recommend that Percent Residential Premises Termination be set equal  
1671 to \*\*\*XXXXX\*\*\* and Percent Business Premises Termination be set equal  
1672 to \*\*\*XXXXX\*\*\*.

1673

1674 **Q. Does this conclude your testimony?**

1675 A. Yes.

---
